

Operations and Maintenance

Wasco Engineering offers operations and maintenance (O&M) services for all compressor, power generation and process equipment. These services are provided as a means of complete production support and can be customised according to customer needs. Wasco hires and trains qualified personnel to support O&M needs to ensure maximum uptime and production.

Three tiers of support are provided to allow for flexibility as per customer needs.

- Manpower support: qualified personnel with centralised control are provided for operational requirements. This helps the customers to operate all equipment under the supervision of experienced personnel with field experience supported by senior engineers from the operational support team of Wasco.
- Manpower with inventory management: along with personnel, operational spares are maintained and replenished as per requirement. This allows an additional layer of support wherein the operational maintenance of equipment is undertaken as part of O&M.
- Comprehensive support: all operational needs are managed directly by Wasco with uptime guarantees. Qualified manpower, all spares and availability guarantees are included to provide a single-stop solution.
