

Conceptual Studies

Concept studies are at the heart of planning for both onshore and offshore developments. Identification and assessment of development options for facilities are crucial in the selection of the most cost-effective solution to take forward to the subsequent project phase and to support investment decisions.

We typically develop optional concepts and present these to our clients in a conceptual selection matrix. Then a screening process will be carried out based on concept selection criteria, which WASCO develops with accordance with the client's requirements.

WASCO's multi-disciplinary team of engineers will perform process simulations, develop the process schemes, study facilities options to decide optimum facilities flow scheme, develop conceptual plant layout and perform all the associated engineering to support the successful delivery of an economic and technically optimal development concept. This empowers our client to progress their project into the Front End Engineering Design phase.
